

TREE TOPOLOGY

By SPY TECH

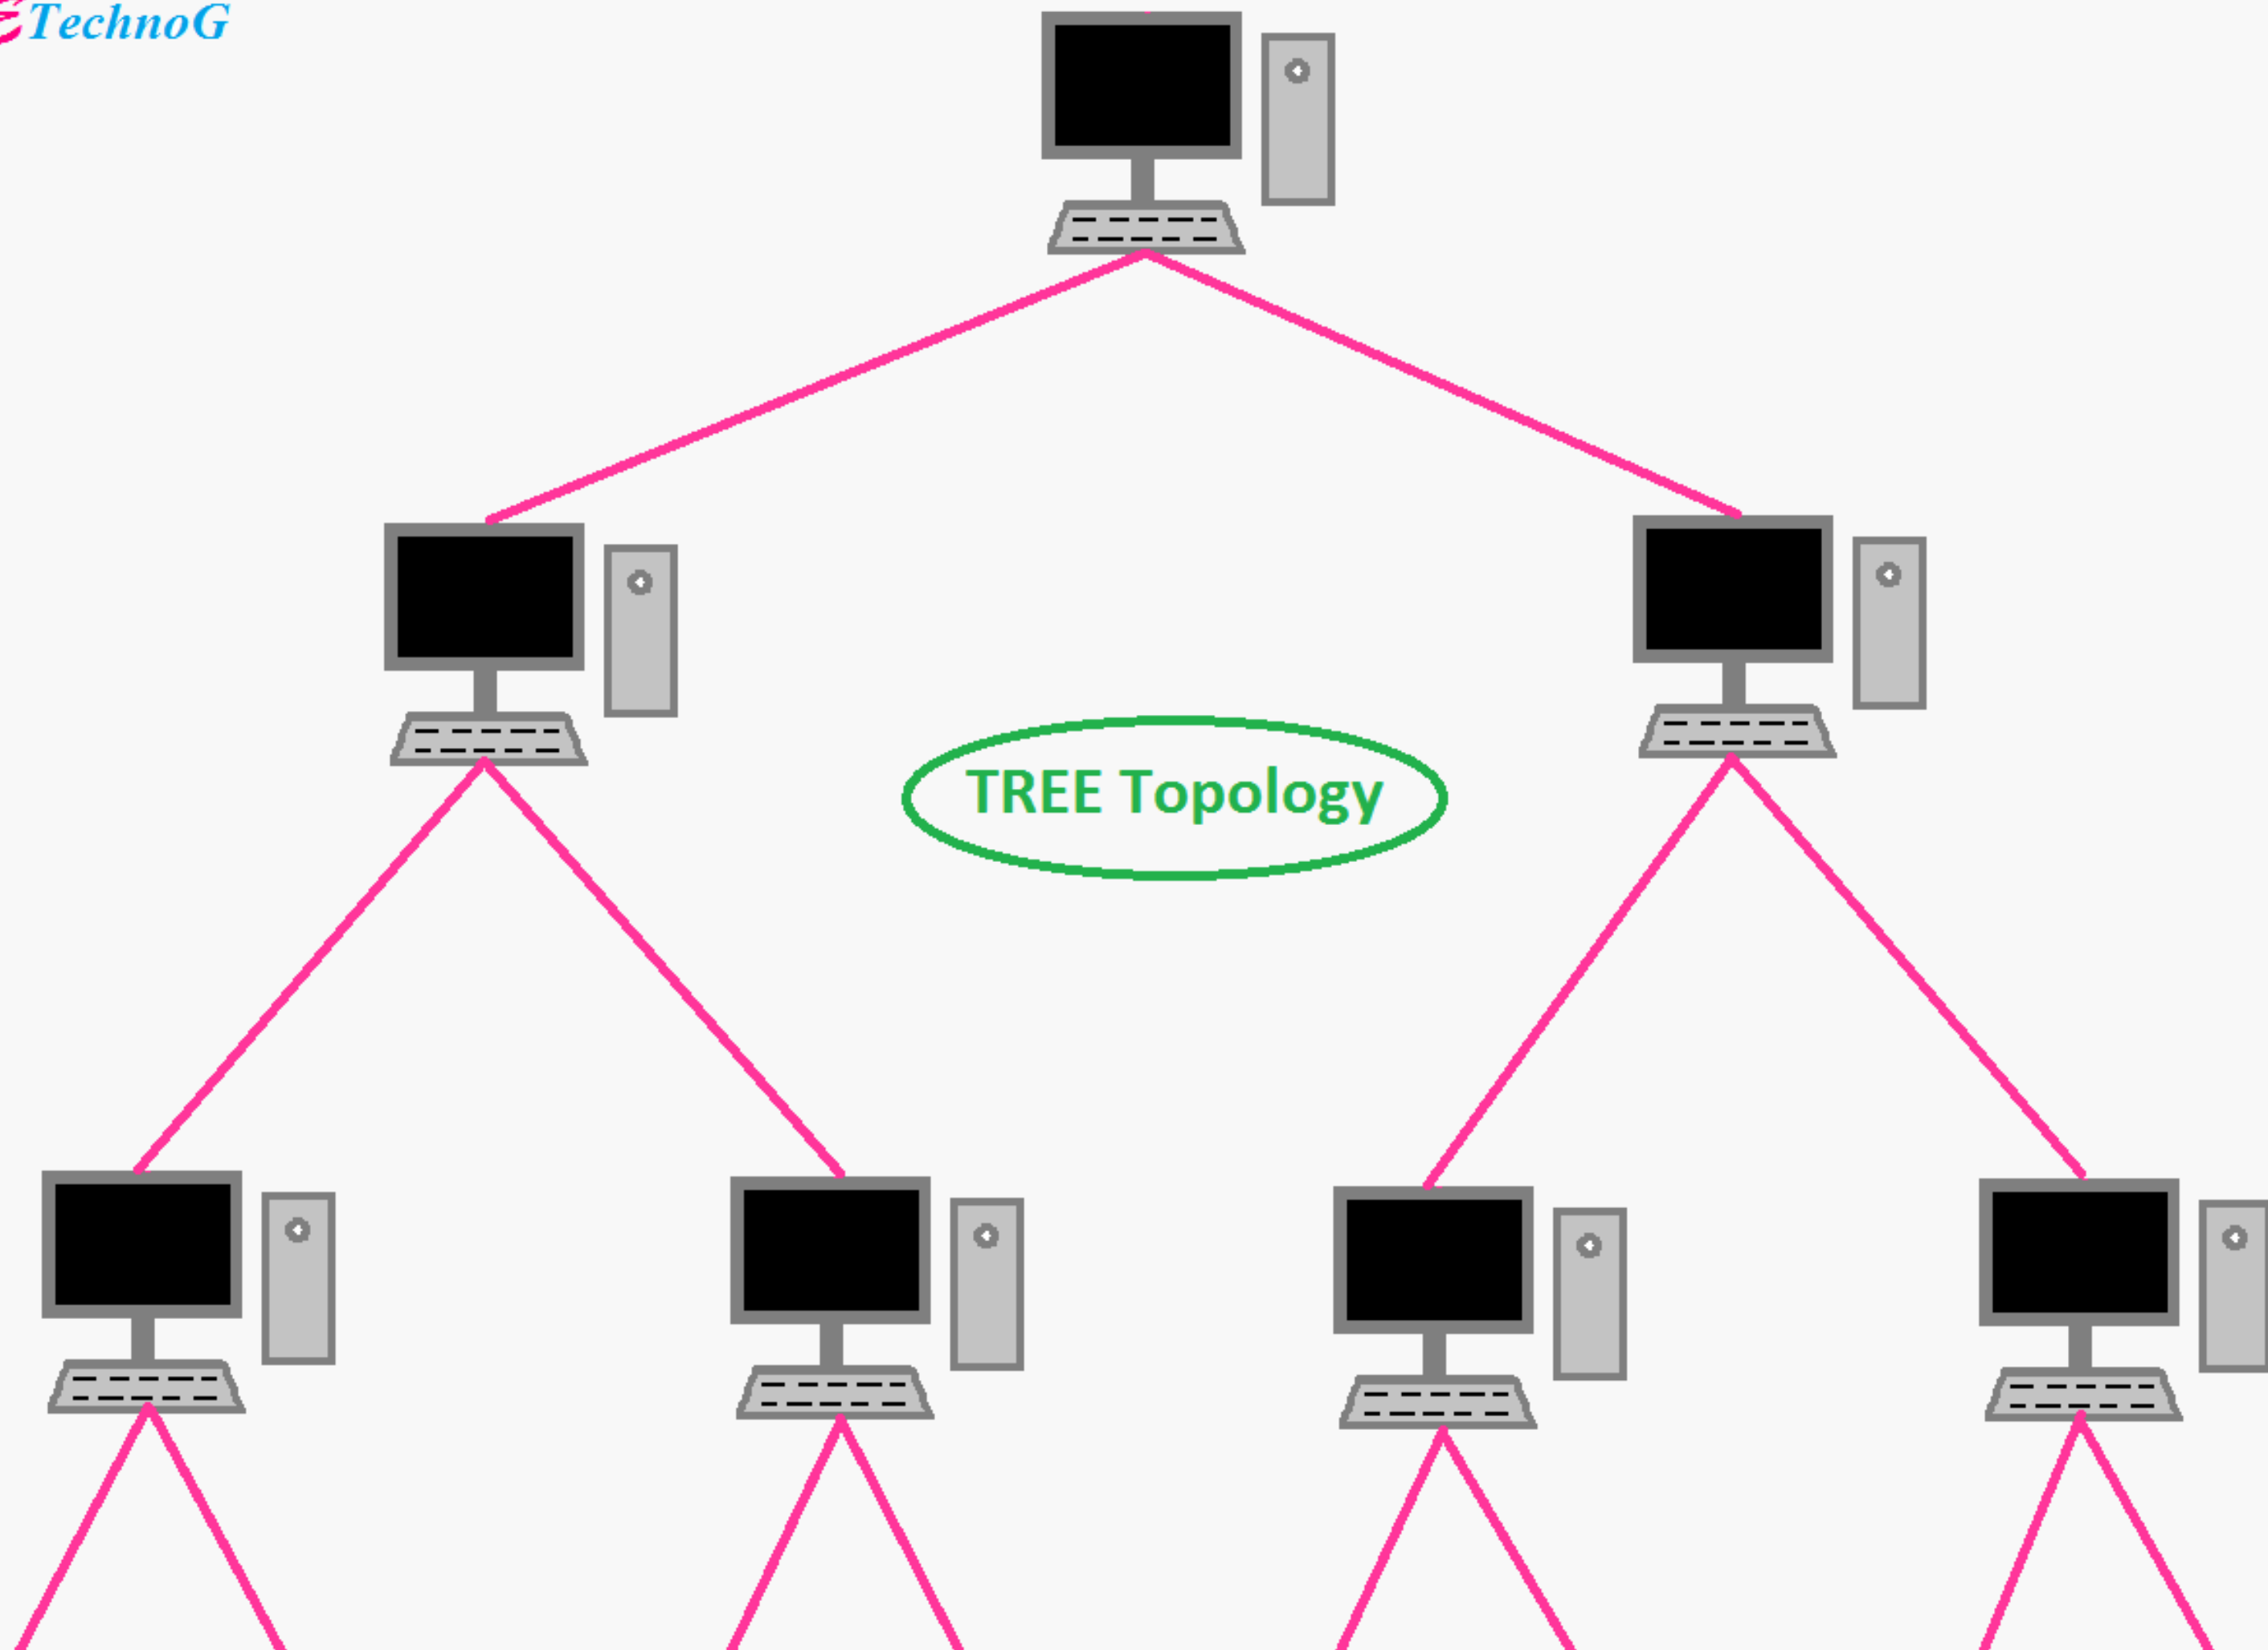

WHAT IS TREE TOPOLOGY?

A tree topology is also known as a star bus topology. It incorporates elements of both a bus topology and a star topology.

In bus topology, different nodes are connected to a single cable while in a star topology, all nodes are connected to a central hub. Tree topology is made by connecting various star topologies via central bus backbone cable. It is used for expansion of the network.

WHAT IS IT USED
FOR?

Tree topology is often used to connect multiple devices, such as printers and computers, in a home or small office. Tree topology is commonly used to create bus networks, where each device is connected to a central server.

ADVANTAGES

- Easier detection of error.
- Failure of a solo node will not disturb the other nodes.
- Tree topology does not require any particular type of cable.
- We can expand tree topology easily.

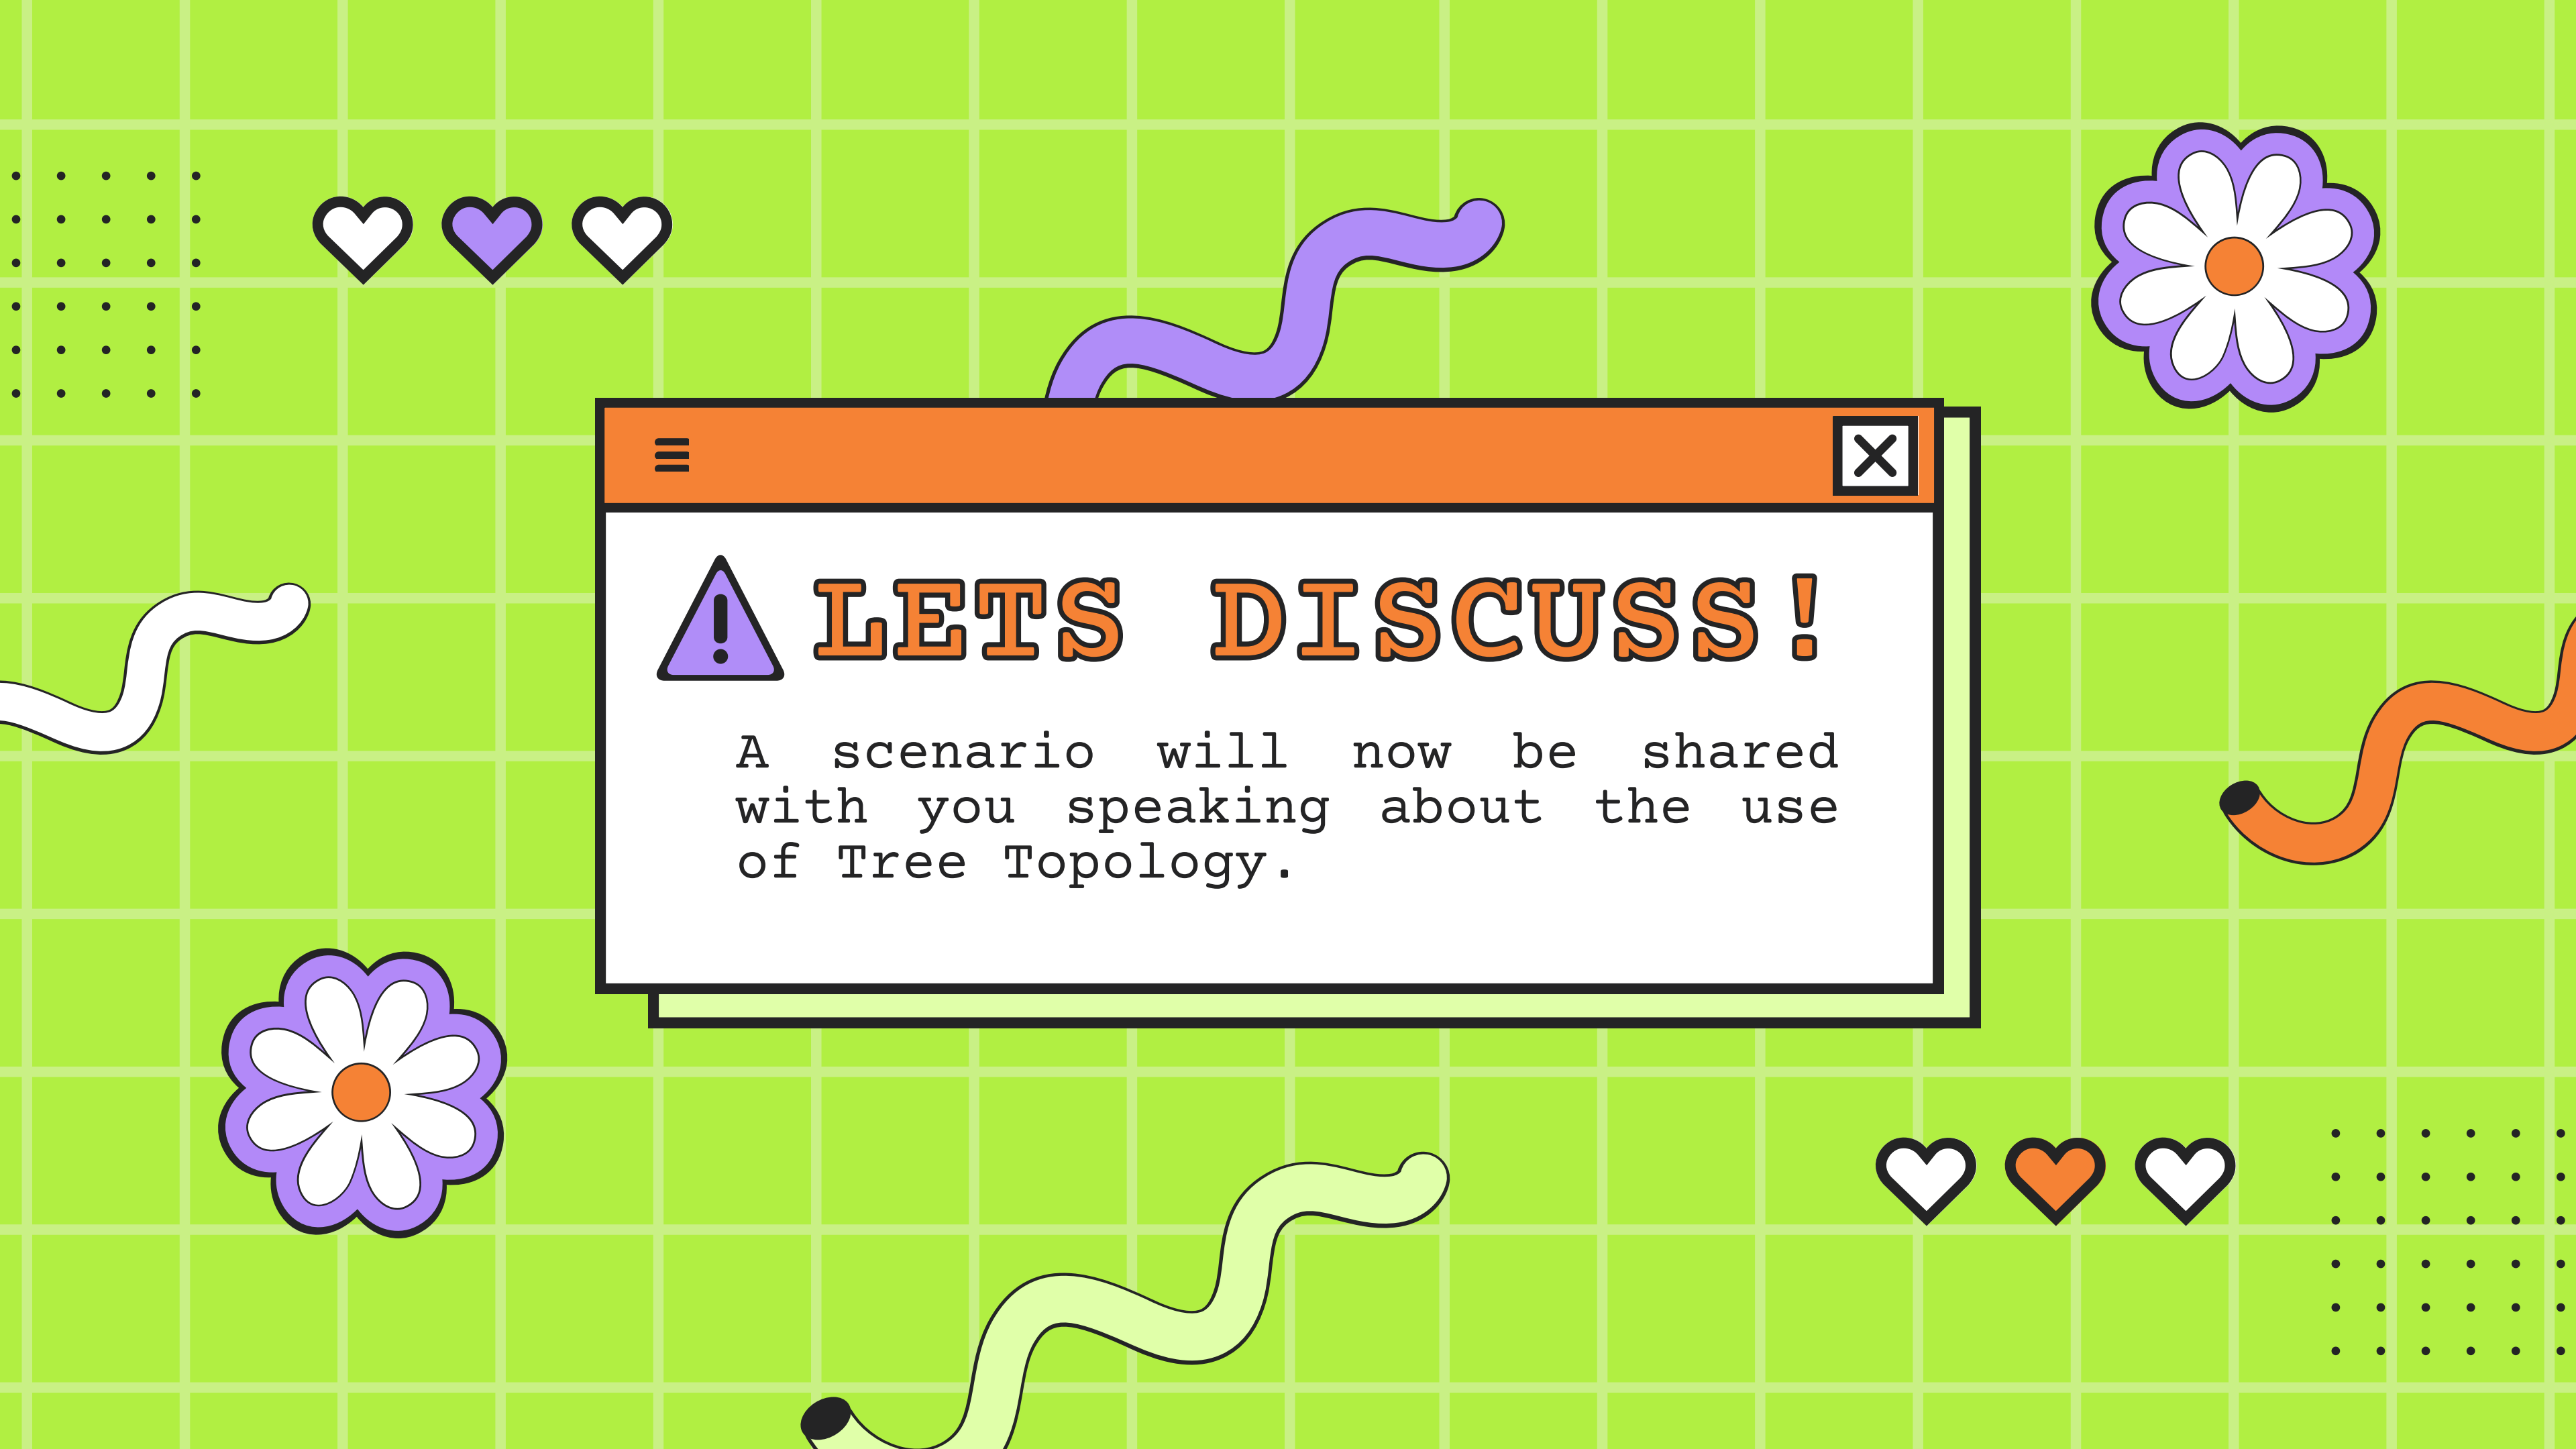

DISADVANTAGES

- Difficulty in maintenance and configuration.
- Difficult to install a tree topology network.
- Tree topology poses high-security threats.
- If the main cable of the topology collapses, the whole network will also collapse.

LETS DISCUSS!

A scenario will now be shared with you speaking about the use of Tree Topology.
